Hello Ilde,

I went back to look and confirmed that yes, none of the samples exceed residential RMLs. I also compared to the RSLs which are much lower values. RSL for chlordane in residential soils is 1.7 mg/kg. The initial two samples collected in 2000 exceeded that value (2.7 mg/kg and 4.1 mg/kg); however, the additional 14 samples collected in April 2001 did not have any exceedances (chlordane detected in two samples at 0.19 mg/kg and 0.11 mg/kg).

Hope that helps!

Hi Kim,

Did you review the attached soil results for comparison with removal numbers? I vaguely remember you said you reviewed them and none of the levels were above removal action levels. Can you refresh my memory?
